Boronic esters, homologation, cross-coupling

Abstract Speech

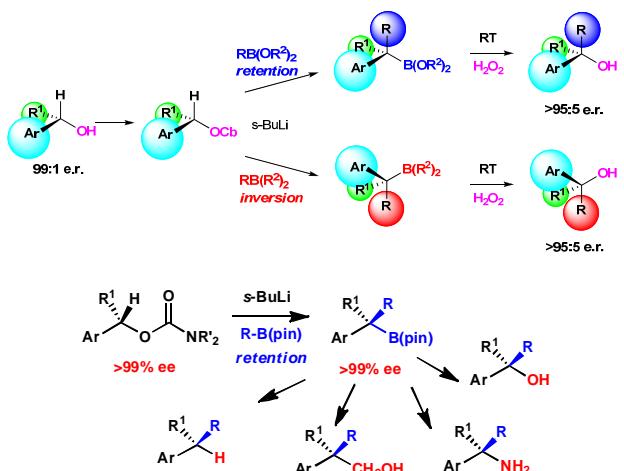

In this lecture I will present our work on the reactions of primary and secondary lithiated carbamates with boranes and boronic esters.¹ These reactions furnish homologated boronic esters with high levels of stereocontrol.

I will show how we use this chemistry to make complex natural and unnatural products in a single operation.²

I will also discuss our recent methodology for the synthesis of tertiary boronic esters and how such intermediates can be used in further stereospecific transformations.³

Finally, I will also describe a new method for the stereospecific cross-coupling of secondary and tertiary chiral boronic esters with electron rich aryl halides.⁴
